
Dialysis: Introduction

From a solitary center in 1971, rapid expansion has occurred in dialysis facilities in the Kingdom of Saudi Arabia. There are presently 175 dialysis centers having 3886 machines catering to 10,203 patients. The ministry of health offers a large percentage of these facilities with contributions made by the Non-MOH government sectors as well as the private sector. Among patients on dialysis, males (54.5%) slightly outnumber females (45.5%). The maximum number of patients is in the socially highly productive age-group of 26 to 45 years. About 6% of the dialysis patients are older than 75 years and only 1.6% are less than 15 years.

Hepatitis B seems to be in good control (4.6%) while hepatitis C continues to be a major problem (29.2% positivity) among dialysis patients. This may be related to frequent travel of patients on dialysis and also because of patients coming from abroad for dialysis in view of the proximity of the holy sites in Makkah, Madina and Jeddah.

Of the 10,203 patients on dialysis, about 17.2% are in the active waiting list for transplantation with another 20% being evaluated for inclusion in the waiting list. It is worthwhile to mention that 32.9% of the dialysis patients are hypertensive, 14.2% are diabetic in addition to 27.8% suffer of both diabetes and hypertension.

The proportion of hemodialysis patients treated by Erthropoietin is 83.3%, and it ranges between 40% and 100% according to center and health sector. Patients with Hematocrit less than 10 g/dl represent 26.2 % of the hemodialysis patients while those with albumin less than 30 g/dl constitute only 13.6%.

Patients also differ greatly with respect to the type of vascular access used; with 73.4% of them use A.V.F, 6.1% use graft, and 12.5% Jugular catheter.

Active patients with serum phosphorus greater than 1.9 mmol/L (6 mg/dl) represent 26.7% of the hemodialysis patients. Whereas patients with serum calcium less than 2.1 mmol/L (8.4 mg/dl) are 20.7%. Vitamin D is used only by 10% of patients as injection while 64.7% of them take it orally. Bicarbonate dialysis mode is used in all dialysis centers throughout the Kingdom with only 6.3% of these centers still use acetate dialysis mode for some patients.

67.4% of the dialysis centers get support of social workers and 62.3% of them get dietitians services.

There has been a constant increase in the number of patients on dialysis over the years and at the present rate it is expected that the number will exceed 11,000 patients by the end of year 2010.
